CREATE & DEPLOY FORMS BASED APPLICATIONS ELIMINATE PAPER FORMS - REDUCE DATA COSTS

With mBiztech's mForms for BlackBerry, organizations are able to streamline their data capture processes, removing the need for paper forms, data re-entry and eliminating lost, incomplete and indecipherable paper records.

The mForms BlackBerry Solution

The mForms solution enables organizations to create custom electronic forms for data capture. Within a matter of hours the solution can be deployed, custom forms created and pushed out wirelessly to specific BlackBerry handhelds. Users are then able to create new records using the form templates and upload those records when ready, to the server.

mForms is ideally suited as a replacement for paper based processes where data is still captured on paper forms and later entered into some form of electronic data repository.

Easy to Deploy and Administer

The mForms solution comes with all the tools required to build and deploy forms based applications, including the mForms Editor. The mForms Editor is an easy to use utility that guides the administrator through the process of creating and managing their application forms.

The administrator can connect to and select the database or CSV file to use as the repository for the form records. Forms can be laid out across multiple pages and each page can contain fields such as checkboxes, combo-boxes and radio groups.

The mForms BlackBerry Client

The mForms BlackBerry Client can be loaded wirelessly Over The Air, or using the Desktop Manager. It provides a user friendly interface allowing users to easily navigate the forms and records on their handhelds.

Using the mForms Client users are able to capture information, and create new records even when no wireless connection is available. Records can be uploaded to the server once a network connection is re-established.

- ✓ SURVEYS
- ✓ TIME SHEETS
- ✓ WORK REPORTS
- ✓ TRACK SALES LEADS
- ✓ OVER-AIR DEPLOYMENT
- ✓ CUSTOMIZABLE & EASY TO USE

Seamless Integration

The mForms solution integrates directly into enterprise data systems such as Lotus Domino, Oracle, SQLServer and DB2. Alternatively, CSV files can be used for simple deployment.

Information captured by BlackBerry users is wirelessly uploaded and inserted into the underlying database system without any expensive integration and customizations costs.

Complete Data Security

The mForms server integrates with the BlackBerry Enterprise Server, using the Mobile Data Service to create a communications tunnel that employs the highest level of encryption, guaranteeing end-to-end data security. All record information is encrypted prior to transmission on the wireless network thereby ensuring total data security.
